

## **Planting Instructions: 12" Hybrid Trees**

**Step 1** → Cut bag off tree plug with scissors or sharp box cutter. Be careful not to cut too deep and damage the roots.

**Step 2** → Plant plug in hole 1-2 feet in diameter and 8-10 inches deep, do not spread roots, just plant plug to dirt line on tree stem / trunk. Fill hole with good quality top soil free from sod, weeds and rocks. Pack dirt so it's free of air pockets and water at the same time you back fill dirt.

**Step 3** → Water tree again until dirt is saturated, then mulch with grass clippings or cedar mulch to help control weeds and hold in moisture. Weeds and grass are your enemy! Keep away! Your planting is complete.

### **Key Tips:**

- If not planting tree in the next 2-3 days, water the trees well in the growing bags and put in partial sun and shade location. The trees can grow for weeks yet in the growing bags.

-After planting, water tree two times a week the first year, pending weather. Do not fertilize the tree the first two years.

-Keep weeds away!

-Protection from animals is key... deer, rabbits, mice. A fence around the tree can prevent damage. I do sell **tree tubes** which add amazing additive to fast growth, less watering and animal protection.
